## 1. DATA DICTIONARY

---

The data dictionary lists all the fields that can be used in a payment form.

First, it presents the main categories (such as technical information, order details, etc.). All the fields that belong to a category are presented.

These tables are presented as follows:

- **Field name:** indicates the name of the parameter as it appears in the HTTP request
- **Format:** data format
- **Description:** description of the field
- **Input:** a field to be transmitted in the request
- **Output:** a field transmitted in the response

The data dictionary also presents the details for each field. Each field is presented as follows:

- **Description:** description of the field
- **Format:** data format (see the table **List of fields and formats** below)
- **Possible values:** expected values when the field must be populated with specific values
- **Example:** example of correct data encoding
- **Error code:** in case there is an error between the merchant website and the payment gateway, the payment gateway indicates the incorrect parameter in the **vads\_extra\_result** field using a numeric code
- **Note:** additional information, elaboration
- **Category:** category to which the field belongs

Precisions on **error codes**:

An **error code** corresponds to the error number when an incorrect payment form is being submitted.

- In test mode this code will be displayed on the payment page.
- In production mode a warning e-mail will be sent specifying the error code and the name of the incorrect parameter.

**Example:** Error 09 corresponds to a payment amount error. The submitted amount does not respect the required format.

<b>Possible values</b>	<b>TEST, PRODUCTION</b>
<b>Category</b>	Technical details

**Description**

Numeric currency code to be used for the payment, in compliance with the ISO 4217 standard.

To use a currency other than euro (978), you must request the activation of the option.

Payment in foreign currency with conversion allows Merchants to present price catalogs in different currencies, but without having to manage their finances in currencies different from the ones specified in their contract.

With this option, when the gateway receives the amount in a currency not managed by your MIDs, it makes a conversion to the company's currency based on the daily exchange rate provided by Visa. For more information, please see the *Offering payment in a foreign currency* chapter of [integration guide](#).

## ■ vads\_extra\_result

### Description

Risk assessment result (specific to shops that have enabled the feature). Its meaning depends on the value entered in **vads\_result**.

- If **vads\_result** equals 30 (request error), then **vads\_extra\_result** contains the numeric code of the field with an error in the value or the format. This value can be set to 99 in case of an unknown error in the request.

**Example:** if **vads\_extra\_result** contains the value 09, it means that the amount specified in **vads\_amount** is incorrect .

- If **vads\_result** equals 05 (declined) or 00 (accepted), **vads\_extra\_result** contains the numeric code of the risk management result.

## ■ vads\_payment\_config

---

### Description

Defines the type of payment: immediate or installment.

- For a single payment, the value must be set to **SINGLE**.
- For an installment payment with fixed amounts and dates, the value must be set to **MULTI**: followed by key=value pairs separated by the ";" character.

The parameters are:

- "**first**" indicates the amount of the first installment (populated in the smallest unit of the currency).
- "**count**" indicates the total number of installments.
- "**period**" indicates the number of days between 2 installments.

The field order associated with MULTI must be respected.

*Note: the **MULTI** value is not available for SEPA payment.*

- For an installment payment with a customized installment schedule, the value must be set to **MULTI\_EXT**: followed by the date=amount pairs separated by the ";" character.

The dates must not be in the past.

*Note: the **MULTI\_EXT** value is not available for SEPA payment.*

Using the MULTI\_EXT value requires a subscription to the **Advanced installment payment** option.

*Note: The value of **vads\_capture\_delay** is not taken into account in the case of payment in installments **MULTI\_EXT**.*

Input and output field, returned in the response (IPN and Return URL).

### Format

enum

### Error code

07

### Possible values

- **SINGLE**
- **MULTI:first= initial\_amount;count=installments\_nb ;period=interval\_in\_days**

*Note: the **MULTI** value is not available for SEPA payment.*

- **MULTI\_EXT:date1=amount1;date2=amount2;date3=amount3**

*Note: the **MULTI\_EXT** value is not available for SEPA payment.*

### Example 1

**MULTI** allows to define an installment payment.

The amount of each installment corresponds to the total amount divided by the number of installments.

The amount of the first installment can be different, it can be specified in **first** parameter.

In case the remaining amount does not equal zero, it will be added up to the amount of the last installment.

Payment request:

- vads\_capture\_delay=2
- vads\_currency=978

- vads\_amount=20000
- vads\_payment\_config=MULTI:first=10000;count=4;period=30

Result:

A first payment of EUR 100.00 will be captured by the bank in 2 days (vads\_capture\_delay).

A second payment of EUR 33.33 will be made in 32 days (vads\_capture\_delay + period).

A third payment of EUR 33.33 will be made in 62 days.

A fourth payment of EUR 33.34 will be made in 92 days.

The total amount is EUR 200.00 (vads\_amount= 20000). The remaining amount has been added to the amount of the last installment.

This instruction allows to immediately create 4 payments with the same transaction number but different sequence numbers (vads\_sequence\_number).

## Example 2

**MULTI\_EXT** allows to define a customized installment schedule. You will be able to define the amount of each installment.

MULTI\_EXT : payment request:

- vads\_currency=978
- vads\_amount=19050
- vads\_payment\_config= MULTI\_EXT:20150601 =10000; 20150701 =4525; 20150808 =4525

Result:

The first payment of EUR 100.00 is scheduled for June 1st 2015.

The second payment of EUR 45.25 is scheduled for July 1st 2015.

The last payment of EUR 45.25 is scheduled for August 8th 2015.

Note:

The total amount must be equal to the value of the **vads\_amount** field. The date of the last installment cannot be later than 12 months after the date when the form was submitted. If the last installment is scheduled later than the card expiry date, no installment will be registered and the buyer will be notified about this issue.

## ■ vads\_sequence\_number

### Description

Transaction sequence number.

Case of single payment (vads\_payment\_config=SINGLE)

**vads\_sequence\_number** is populated with 1 in case of single payment.

However, if the merchant has authorized several payment attempts after a rejected payment, the sequence number will be incremented upon each new attempt.

The number of additional attempts after a rejected payment can be configured via the Merchant Back Office (menu **Settings > Shop > Configuration**).

If **vads\_payment\_config** = **SINGLE**:

<b>vads_url_check_src</b>	<b>vads_sequence_nu</b>	<b>Description</b>
PAY	1	Payment made in 1 attempt
	2	Payment made in 2 attempts
	3	Payment made in 3 attempts
BATCH_AUTO	1	Deferred payment made in 1 attempt
	2	Deferred payment made in 2 attempts
	3	Deferred payment made in 3 attempts

Case of installment payment (vads\_payment\_config=MULTI)

With the application of Soft Decline, the **vads\_sequence\_number** field no longer allows to easily identify the first installment of a payment in installments.

To identify the first payment of a series, view the description of the **vads\_occurrence\_type** field.

Case of a cascading payment (vads\_card\_brand=MULTI)

In case of a cascading payment (the cart items are paid with several payment methods), the **vads\_sequence\_number** field is always set to **0**.

The **vads\_payment\_seq** field describes each transaction in a table in JSON format.

The **transaction[x].sequence\_number** attribute takes the same values as the **vads\_sequence\_number** field, as described for the case of single payment.

**Note:**

The **vads\_sequence\_number** field is not returned in the response when a payment is canceled or abandoned.

#### ■ vads\_sub\_desc

**Description** Mandatory parameter used for creating a recurring payment.

It designates the recurring payment rule to be applied.

The expected value for this parameter is a chain of characters that comply with the **iCalendar** (Internet Calendar) specification, described in RFC5545 (see <http://tools.ietf.org/html/rfc5545>).

Among other aspects, this specification allows to define complex recurring payment rules via the **RRULE** property.

For technical reasons, it is not possible to define recurring payment periods that are shorter than one day.

The keywords "SECONDLY" / "MINUTELY" / "HOURLY" are not taken into account.

Examples:

- To program installment payments taking place on the last day of each month for 12 months, the rule is:  
**RRULE:FREQ=MONTHLY;BYMONTHDAY=28,29,30,31;BYSETPOS=-1;COUNT=12**  
This rule means that if the current month does not have 31 days, the machine will take the 30th into account. If there is no 30th day in a month, the machine will take the 29th into account, and so on until the 28th.  
Another version of this rule:  
**RRULE:FREQ=MONTHLY;COUNT=5;BYMONTHDAY=-1**
- To program installment payments on the 10th of each month for 12 months, the rule is: **RRULE:FREQ=MONTHLY;COUNT=12;BYMONTHDAY=10**
- To program installment payments every three months up to December 31st, 2016.  
**RRULE:FREQ=YEARLY;BYMONTHDAY=-1;BYMONTH=1,4,7,10;UNTIL=20161231**  
The installment payments will be due on the first day of January, April, July and October each year. The total number of installments depends on the recurring payment start date (see **vads\_sub\_effect\_date** parameter).

- In order to define a weekly recurring payment to be made every Monday:  
**RRULE:FREQ=WEEKLY;BYDAY=MO**  
The installments will be made every Monday. Note that the first installment will occur the nearest Monday.
- In order to define a weekly recurring payment: **RRULE:FREQ=WEEKLY**  
The installments will occur on the same day if the due date is set to “today”, then every 7 days.
- In order to define a recurring payment every two weeks on Monday, with maximum 4 installments:  
**RRULE:FREQ=WEEKLY;INTERVAL=2;COUNT=4;BYDAY=MO**
- In order to define a recurring payment every two weeks, on the same day and every 7 days: **RRULE:FREQ=WEEKLY;INTERVAL=2;**
- For more information and examples, visit <http://recurrence.sourceforge.net/>.

### Description

Mandatory parameter.

Corresponds to the timestamp in the YYYYMMDDHHMMSS format.

**The timestamp must necessarily correspond to the current date and time, in the GMT + 0 (or UTC) time zone in 24h format.**

#### Note:

If you are using REST payment web services, the equivalent of the vads\_trans\_date parameter is **transactions[0].transactionDetails.cardDetails.legacyTransDate**.

*Input and output field, returned in the response (IPN and Return URL).*

### Format

n14

### Error code

04

#### Frequent errors:

- The date has not been submitted in the YYYYMMDDHHMMSS format (year, month, day, hour, minute, second).
- The date is not based on the UTC time zone (Coordinated Universal Time).  
Make sure you use date functions in your programming language that will generate a UTC hour (e.g.: gmdate in PHP).
- The time must be calculated using the 24h format, not 12h.
- The buyer has waited for too long before clicking on **Pay**.
- The buyer was using browser history.

## ■ vads\_trans\_status

### Description

Allows to set the status of the transaction.

*Output field, returned in the response (IPN and Return URL).*

### Format

enum

### Possible values

Value	Description
<b>ABANDONED</b>	<b>Abandoned</b> Payment abandoned by the buyer The transaction has not been created, and <b>therefore cannot be viewed in the Merchant Back Office.</b>
<b>ACCEPTED</b>	<b>Accepted.</b> Status of a VERIFICATION type transaction for which the authorization request or information request has been successfully completed. This status cannot evolve. Transactions with the “ <b>ACCEPTED</b> ” status will never be captured.
<b>AUTHORISED</b>	<b>Waiting for capture</b> The transaction has been accepted and will be automatically captured at the bank on the expected date.
<b>AUTHORISED_TO_VALIDATE</b>	<b>To be validated</b> The transaction, created with manual validation, is authorized. The merchant must manually validate the transaction in order for it to be captured. The transaction can be validated as long as the expiration date of the authorization request has not passed. If the authorization validity period has passed, the payment status changes to <b>EXPIRED</b> . The <b>Expired</b> status is final.
<b>CANCELLED</b>	<b>Canceled</b> The transaction has been canceled by the Merchant.
<b>CAPTURED</b>	<b>Captured</b> The transaction has been captured by the bank.
<b>CAPTURE_FAILED</b>	<b>Capture failed</b> Contact the technical support.
<b>EXPIRED</b>	<b>Expired</b> This status appears in the lifecycle of a payment with deferred capture. The expiry date of the authorization request has passed and the merchant has not validated the transaction. The account of the cardholder will therefore not be debited.
<b>REFUSED</b>	<b>Refused</b> The transaction is refused.

Value	Description
<b>SUSPENDED</b>	<b>Suspended</b> The capture of the transaction is temporarily blocked by the acquirer (AMEX GLOBAL or SECURE TRADING). Once the transaction has been correctly captured, its status changes to <b>CAPTURED</b> .
<b>UNDER_VERIFICATION</b>	<b>Control in progress</b> Waiting for the response from the acquirer. This status is temporary. A notification will be sent to the merchant website to inform the Merchant of the status change. Requires the activation of the Instant Payment Notification URL on batch change notification rule.
<b>WAITING_AUTHORISATION</b>	<b>Waiting for authorization</b> The capture delay in the bank exceeds the authorization validity period.
<b>WAITING_AUTHORISATION_TO_VALIDATE</b>	<b>To be validated and authorized</b> The capture delay in the bank exceeds the authorization validity period. A EUR 1 (or information request about the CB network if the acquirer supports it) authorization has been accepted. The merchant must manually validate the transaction for the authorization request and the capture to occur.

**Category** Redirection to the merchant website.

## ■ vads\_url\_post\_wallet

---

**Description** This field allows the merchant to transmit the URL to which the buyer will be redirected during a payment via a wallet in two steps.

This URL is used for transmitting information relative to the buyer's choice (e-mail, shipping address, payment method, etc.).

Based on these elements, the merchant can decide what to do (adjust the shipping fees, register the payment method, etc.) before allowing the buyer to finalize his or her payment.

The details will be transmitted to the merchant website via an html POST form.

Example: vads\_url\_post\_wallet = https://mydomain-name.com/return\_url

### **Note**

*If the URL is inaccessible, the transaction cannot be finalized. After the payment session expires, a **rejected** transaction will be created. If the merchant has configured the notification rule for abandoned/canceled transactions, the merchant website will be notified about the reason of rejection via the*

**vads\_payment\_error** field. This field will be set to **149** indicating that the payment session has expired.

It will then become visible in the Merchant Back Office, in the **Event log** tab.

Input and output field, returned in the response (IPN and Return URL).
